- intuition
- merge
- $[\ensuremath{^*}]$ fancy merging (skip, you may do it at home for extra credit)
- append, reshape, xpose
- [*] joinby (skip)

let's pull up your code

• let's start by discussing your code

intuition

merge

[*] fancy merging (skip, you may do it at home for extra credit)

append, reshape, xpose

[*] joinby (skip)

merge, append, reshape, xpose, joinby

• merge is most important

operhaps the most important command for dat man

• reshape is useful and difficult

• append, xpose, joinby are rare

merge v append

• draw a picture

- and https://www.stata.com/manuals/u22.pdf
- also https://www.ssc.wisc.edu/sscc/pubs/sfr-combine.htm

intuition

merge

[*] fancy merging (skip, you may do it at home for extra credit)

append, reshape, xpose

[*] joinby (skip)

the power of merge

- merging is one of the most useful things you'll learn here
- great value comes from simple fact of merging data
- recall from intro: there is a ton data of (and growing!)
- but these data are useless unless in one file!
- somehow organizations are in this persistent habit of having their data chopped up in tiny multiple files
- they are hungry for knowledge and want to make use of the data
- this is where you come in! can make \$ by just merging!

easy to merge; difficult to do it right

- it depends on what kind of data (and luck) you have
- the challenge is to check what happened after the merge
- sometimes it all merges smoothly without any issues
- but almost always it doesn't
- and then the work begins
- always investigate carefully non-merges
- make sure that *ALL* nonmerges are as expected
- even matches can be wrong
- ouse a lot of des sta to investigate
- \circ always be skeptical, ask yourself whether it makes sense

after merge

- typically some obs did not merge due to diff coding
- say "Poland \neq "Republic of Poland"
- "CAMDEN" \neq " Camden" etc
- then go back and fix it before merge:

• replace ctry="Poland" if ctry=="Republic of Poland"

- in many cases it was not supposed to merge, say
- $\circ \, there \, was \, country \, in \, A, \, but \, not \, in \, B$
- $\circ\,\text{data}$ in A was for 1995-2000, in B 1990-1998

<u>o</u>etc

• but you have to be 100% sure that nonmerges were correct to happen!

to be honest

- to confess, what I sometimes do:
- $\circ\,I$ simply make a note to myself that I do not care now
- $\circ\,\text{and}$ I will investigate it later, that is
- $\circ I$ just put in there a '*LATER:' comment
- $\circ\,\text{but}$ I only do that if problem is small say around 5% of obs

dirty data

- $\diamond\,$ the other challenge is to deal with dirty data
- ◊ most data are dirty:
- weird chars, mistakes, inconsistent names/codes, missing vals
- weird chars: %, \$, #, etc or non-english letters
- mistakes: should be 9, but it is 5, etc
- inconsistent names/codes: 'Camden'≠'CAMDEN'

merge

- combines variables (same obs)
- let's generate some data first
- ◊ use gss.dta, clear
- ♦ gen id=_n
- ♦ keep id region
- ◊ save gss1.dta, replace (using) has region
- ◊ use gss.dta, clear
- ♦ gen id=_n
- ♦ keep id inc (master) has inc
- merge 1:1 id using gss1.dta (combine with (using))

merge contn'd

- ◊ after merging **always** think about output:
- ♦ tab _merge
- $\diamond~$ variable _merge takes on 3 values:
- $\diamond~3$ obs in both datasets
- $\diamond~1$ obs in master only
- $\diamond~2$ obs in using only

merging investigation

• from my experience, I have found particularly useful:

• tab _merge with time and geography

 $\circ \, \text{say}$ year and state

- may also want to list or edit part of datafile
 especially if it is small
- $\bullet\, {\sf can}$ also sort on $_{\sf merge}$ and other key vars
- it does take time to find out what happened

- often you merge 1:m
- very useful command indeed
- but people often make a mistake of specifying merge m:m
- and I have never seen, cannot even think of situation when this would be applicable

sometimes need to collpase!

- sometimes may have many (non-unique) obs in one dataset
- and so the same in the other dataset
- say multiple animal abuses per zip in one
- and multiple shelters per zip in the other one
- cannot merge it !! need to collapse less important one
- say you're primarly interested in abuse, then collapse shelters
- say count them by zip
- and merge that 1:m with multiple abuses by zip

be clear about merging

want to be clear about nonmergers in paper!
say how many nonmerges and waht you did about it
eg dropped, fixed, etc

merging multiple files

- can merge at once
- merge 1:1 id using A B C D
- o avoid at once, too messy
- better in some steps, eg A+B, C+D, AB+CD
- $\circ\, or$ perhaps best A+B, AB+C, ABC+D, etc
- perhaps best first do easy and clean merges

1:1 merge on 2 vars

- ofen need to merge 1:1 on 2 vars
- o when 2 vars uniqely define obs
- o eg country-year, state-county

• merge 1:1 countryID year using B

what to merge on?

- geography! usually have some!
- can always aggregate up! say have city and state, so can merge m:1 on state
- time! say with weather-usually weather matters!
- occupation! there are occ codes eg https:

//www.onetonline.org/find/descriptor/result/4.A.2.b.2

intuition

merge

$[\ensuremath{^*}]$ fancy merging (skip, you may do it at home for extra credit)

append, reshape, xpose

[*] joinby (skip)

[*] fancy merging (skip, you may do it at home for extra credit)

merging non-matching ids

http://stats.stackexchange.com/questions/32830/

 ${\tt suggestions-on-how-to-merge-multiple-datasets-with-an-imperfect-i}$

(1) The Catcher and the Rye, 7/16/51

- (2) The Catcher & the Rye, 7/16/51
- (3) Catcher and the Rye, 1951
- (4) The Catcher and the Rye (1951), [missin

[*] fancy merging (skip, you may do it at home for extra credit)

merging non-matching ids

- ssc install strgroup
- uses Levenshtein distances to do string matchingreclink
- probabilistic matching scheme
- •http://github.com/OpenRefine

intuition

merge

[*] fancy merging (skip, you may do it at home for extra credit)

append, reshape, xpose

[*] joinby (skip)

append, reshape, xpose

Append

- ◊ Combines Observations (Same Var)
- ◊ Let's generate some data first
- use gss.dta, clear \diamond keep in 1/50 \diamond save gss1.dta, replace (using) \diamond use gss.dta, clear \diamond keep in 51/100 (master) \diamond append using gss1.dta (combine with (using) \diamond dofile
- ◊ append is easy in practice as compared to merge

append, reshape, xpose

we are about to look at reshape

- reshape is a very peculiar command
- incredibly powerful, and difficult to understand
- i thought i have mastered stata
- but whenever i reshape, i always scratch my head
- yet reshape is the only way out in many situations
- we will try to use it often

xpose, reshape

- ◊ xpose interchanges Vars and Obs
- reshape converts wide-to-long/long-to-wide
- help reshape (very useful diagram—i always use it!)
- ◊ reshape long var, i(id) j(year)
- ◊ var is a common part of var that repeats, i.e. prefix,
- ◊ id is always unique (eg made by gen id=_n)
- year is a new variable that takes unique part from variable that repeats, i.e. suffix

reshape example

- ◊ use gss.dta, clear
- ◊ ren inc inc1
- ◊ gen inc2=2*inc1
- \diamond gen id=_n
- reshape long inc, i(id) j(period)
- ♦ edit
- ♦ dofile
- and lets go over output of reshape—it tells you how it changed!

intuition
